

APPLICATION NOTE

Rapid Analysis of Natural Gas Composition Using a Single Module Micro GC Fusion[®]

INTRODUCTION

Rapid and precise analysis of the chemical composition and physical properties of natural gas is critical for natural gas producers, gatherers, and gas distribution companies for custody transfer. In addition, natural gas engine, boiler, and appliance manufacturers rely on natural gas calculations to determine key development specifications, such as thermal efficiency.

Due to the variations in natural gas composition, it is necessary to monitor the physical properties of the gas, such as compressibility, relative density, and heating value (in British thermal units, or BTU). Small differences in heating value can have significant financial impacts.

Building on proven microelectromechanical systems (MEMS) technology, Micro GC Fusion is capable of analyzing C1-C8 "plus" (methane through octanes "plus" hydrocarbons and fixed gases present in natural gas) using a single module. The temperature programmable column allows for runs to be conducted quickly, reducing the cycle time of analyses and increasing sample throughput. Temperature programming also allows for rapid column cleaning, which prevents contaminants from remaining in the column and negatively impacting its lifetime.

The web-based Micro GC Fusion user interface combined with Diablo EZReporter automatically calculates chemical composition and physical properties after each sample run. The software generates a standard report using industry specific methods from one of the following standards:

- ♦ GPA (Gas Processors Association) 2172, 2145-09
- ♦ ASTM (American Society of Testing and Materials) D3588
- ♦ ISO (International Standards Organization) 6976

EXPERIMENTAL

Ten runs of a natural gas calibration standard were analyzed on a single module Micro GC Fusion containing a 12 meter RT-Q-BOND temperature programmable column. The temperature ramping profile was optimized to elute C1-C8 components within four minutes. [Table 1](#) displays the concentration amounts present in the calibration gas standard.

RESULTS

With isothermal operation, C4-C8 Plus components do not elute within an acceptable time frame, resulting in carryover. Propane elutes late with a broad peak shape. With temperature programming, the RT-Q-BOND analysis is extended to C8 Plus, providing sharp peaks for all desired components. Within four minutes, all components of interest were resolved and quantified. [Figure 1](#) displays the chromatogram of the natural gas calibration standard.

Micro GC Fusion exhibits excellent area repeatability over ten consecutive runs. The area percent relative standard deviation (%RSD) values are listed in [Table 2](#). [Figure 2](#) displays a sample natural gas analysis report from Diablo EZReporter.

CONCLUSION

Temperature programming permits a single module Micro GC Fusion to reliably analyze natural gas components up to C8 Plus within four minutes. Measurement results are automatically displayed in a tabulated format on the web-based user interface after the analysis is complete. When coupled with the optional Diablo EZReporter software, industry compliant natural gas analysis reports can be automatically generated upon completion of the sample run, providing valuable information for custody transfer situations.

Table 1 Natural gas calibration standard concentration information

Component	Mole %
nitrogen	1.525
methane	88.67
carbon dioxide	1.206
ethane	2.994
propane	2.006
isobutane	1.004
n-butane	0.996
isopentane	0.300
n-pentane	0.300
hexanes	0.603
heptanes	0.320
octanes "plus"	0.075

Figure 1 Chromatogram of the natural gas calibration standard

Column: RT-Q-BOND, 12 m

Column Temperature: 60°C (hold 50 s) -> 127°C (hold 10 s) -> 220°C (hold 110 s); 2°C/s, 2.5°C/s

Column Head Pressure: 30 psi

Table 2 Repeatability data for ten runs of the natural gas calibration standard

Number of Component	Component	Retention Time (s)	Area %RSD
1	nitrogen	29.48	0.314
2	methane	30.19	0.359
3	carbon dioxide	34.70	0.414
4	ethane	47.04	0.402
5	propane	86.09	0.660
6	isobutane	113.33	0.426
7	n-butane	118.48	0.454
8	isopentane	136.40	0.449
9	n-pentane	139.37	0.439
10	hexanes	Group Range	0.403
11	heptanes	Group Range	0.827
12	octanes "plus"	Group Range	1.186
